Replacement of AGM and EFB batteries – VAG Battery Management

Dear sir or madam,

today's vehicle battery management systems are very complex. Therefore, the replacement of AGM and EFB batteries require the input of specific data.

As almost every vehicle manufacturer uses their own process, detailed information must be obtained from vehicle maintenance documentation or guided routines of vehicle diagnostics systems.

During the replacement process of AGM and EFB batteries in VAG vehicles the battery manufacturer's name has to be selected in the diagnostic tools menu.

If Continental „CAG“ is not available in the manufacturer's list, „unknown“ has to be chosen, followed by the requested battery specific information.

Serial number input: VAG OEM batteries are marked with a 10-digit serial number. As Continental aftermarket batteries do not come with such a serial number, any 10-digit code can be keyed in.

Please note that we are in contact with the main manufacturers of vehicle diagnostics systems to add Continental „CAG“ as a battery manufacturer in their tools.

With kind regards
Product Management
